Technical Deep Dive

# What is Hyperledger Fabric

- Linux Foundation Hyperledger
  - A collaborative effort created to advance cross-industry blockchain technologies for business
- Hyperledger Fabric
  - An implementation of blockchain technology that is intended as a foundation for developing blockchain applications
  - Key technical features:
    - A shared ledger and smart contracts implemented as “chaincode”
    - Privacy and permissioning through membership services
    - Modular architecture and flexible hosting options
- V1.0 released July 2017: contributions by 159 engineers from 27 organizations
  - IBM is one contributor to Hyperledger Fabric

# Hyperledger Fabric V1 Architecture

# Overview of Hyperledger Fabric v1 – Design Goals

- Better reflect business processes by specifying who endorses transactions
- Support broader regulatory requirements for privacy and confidentiality
- Scale the number of participants and transaction throughput
- Eliminate non deterministic transactions
- Support rich data queries of the ledger
- Dynamically upgrade the network and chaincode
- Support for multiple credential and cryptographic services for identity
- Support for "bring your own identity"

Technical Deep Dive

# Recall key blockchain concepts

# Hyperledger Fabric V1 - Deep Dive Topics

- Network Consensus
- Channels and Ordering Service
- Network setup
- Endorsement Policies
- Permissioned ledger access
- Pluggable world-state

# **Network Consensus**

## Nodes and roles

	Committing Peer: Maintains ledger and state. Commits transactions. May hold smart contract (chaincode).
	Endorsing Peer: Specialized committing peer that receives a transaction proposal for endorsement, responds granting or denying endorsement. Must hold smart contract
	Ordering Nodes (service): Approves the inclusion of transaction blocks into the ledger and communicates with committing and endorsing peer nodes. Does not hold smart contract. Does not hold ledger.

# Sample transaction: Step 1/7 – Propose transaction

Application proposes transaction

Endorsement policy:

- “ $E_0, E_1$  and  $E_2$  must sign”
- ( $P_3, P_4$  are not part of the policy)

Client application submits a transaction proposal for Smart Contract A. It must target the required peers  $\{E_0, E_1, E_2\}$

Key:

Endorser	(Blue square)	Ledger
Committing Peer	(Grey square)	Application
Ordering Node	(Green square)	
Smart Contract (Chaincode)	(Yellow square)	Endorsement Policy

## Sample transaction: Step 2/7 – Execute proposal

### Endorsers Execute Proposals

E<sub>0</sub>, E<sub>1</sub> & E<sub>2</sub> will each execute the proposed transaction. None of these executions will update the ledger

Each execution will capture the set of Read and Written data, called RW sets, which will now flow in the fabric.

Transactions can be signed & encrypted

Key:

Endorser		Ledger
Committing Peer		Application
Ordering Node		
Smart Contract (Chaincode)		Endorsement Policy

## Sample transaction: Step 3/7 – Proposal Response

Application receives responses

RW sets are asynchronously returned to application

The RW sets are signed by each endorser, and also includes each record version number

(This information will be checked much later in the consensus process)

Key:

Endorser		Ledger
Committing Peer		Application
Ordering Node		
Smart Contract (Chaincode)		Endorsement Policy

## Sample transaction: Step 4/7 – Order Transaction

Application submits responses for ordering

Application submits responses as a transaction to be ordered.

Ordering happens across the fabric in parallel with transactions submitted by other applications

Key:

Endorser		Ledger
Committing Peer		Application
Ordering Node		
Smart Contract (Chaincode)		Endorsement Policy

## Sample transaction: Step 5/7 – Deliver Transaction

Orderer delivers to all committing peers

Ordering service collects transactions into proposed blocks for distribution to committing peers. Peers can deliver to other peers in a hierarchy (not shown)

Different ordering algorithms available:

- SOLO (Single node, development)
- Kafka (Crash fault tolerance)

Key:

Endorser		Ledger
Committing Peer		Application
Ordering Node		
Smart Contract (Chaincode)		Endorsement Policy

## Sample transaction: Step 6/7 – Validate Transaction

Committing peers validate transactions

Every committing peer validates against the endorsement policy. Also check RW sets are still valid for current world state

Validated transactions are applied to the world state and retained on the ledger

Invalid transactions are also retained on the ledger but do not update world state

Endorser	Ledger	Application
Committing Peer	■	□
Ordering Node	■	□
Smart Contract (Chaincode)	■	□

Endorsement Policy

## Sample transaction: Step 7/7 – Notify Transaction

Committing peers notify applications

Applications can register to be notified when transactions succeed or fail, and when blocks are added to the ledger

Applications will be notified by each peer to which they are connected

Key:

Endorser		Ledger
Committing Peer		Application
Ordering Node		
Smart Contract (Chain code)		Endorsement Policy

## **Channels and Ordering Service**

# Ordering Service

The ordering service packages transactions into blocks to be delivered to peers. Communication with the service is via channels.

Different configuration options for the ordering service include:

- SOLO
  - Single node for development
- Kafka : Crash fault tolerant consensus
  - 3 nodes minimum
  - Odd number of nodes recommended

# Channels

Separate channels isolate transactions on different ledgers

- Chaincode is installed on peers that need to access the worldstate
- Chaincode is instantiated on specific channels for specific peers
- Ledgers exist in the scope of a channel
  - Ledgers can be shared across an entire network of peers
  - Ledgers can be included only on a specific set of participants
- Peers can participate in multiple channels
- Concurrent execution for performance and scalability

# Single Channel Network

- Similar to v0.6 PBFT model
- All peers connect to the same system channel (blue).
- All peers have the same chaincode and maintain the same ledger
- Endorsement by peers E<sub>0</sub>, E<sub>1</sub>, E<sub>2</sub> and E<sub>3</sub>

Key:

Endorser		Ledger
Committing Peer		Application
Ordering Node		
Smart Contract (Chaincode)		Endorsement Policy

# Multi Channel Network

- Peers E<sub>0</sub> and E<sub>3</sub> connect to the **red** channel for chaincodes **Y** and **Z**
- Peers E<sub>1</sub> and E<sub>2</sub> connect to the **blue** channel for chaincodes **A** and **B**

Key:

Endorser		Ledger
Committing Peer		Application
Ordering Node		
Smart Contract (Chaincode)		Endorsement Policy

## Future 2 network topology

- Peers will be able to connect to channels served by different ordering services.
- The peer is not connecting the three blockchain networks but is maintaining a ledger for different channels.

## Future 3 network topology

- Peers will be able to connect to channels served by different ordering services.
- The peer is not connecting the three blockchain networks but is maintaining a ledger for different channels.

# Future Network of Networks

# **Network Setup**

# Installing and instantiating smart contract Chaincode

Operator installs then instantiates

Operator **installs** smart contracts with endorsement policies to appropriate peers: E<sub>0</sub>, E<sub>1</sub>, E<sub>2</sub>, P<sub>3</sub>, and not P<sub>4</sub>

Operator **instantiates** smart contract on given channel. One-time initialization

Policy subsequently available to all peers on channel, e.g. including P<sub>4</sub>

Endorser		Ledger
Committing Peer		Application
Ordering peer		
Smart Contract (Chaincode)		Endorsement Policy

# Bootstrapping the Network (1/6) – Configure & start Ordering Service

Hyperledger Fabric

- An Ordering Service is configured and started for other network peers to use  
`$ docker-compose [-f orderer.yml] ...`

## Bootstrapping the Network (2/6) – Configure and Start Peer Nodes

- A peer is configured and started for each Endorser or Committer in the network  
`$ peer node start ...`

## Bootstrapping the Network (3/6) – Install Chaincode

- Chaincode is installed onto each Endorsing Peer that needs to execute it  
`$ peer chaincode install ...`

## Bootstrapping the Network (4/6) – Create Channels

- Channels are created on the ordering service  
`$ peer channel create -o [orderer] ...`

## Bootstrapping the Network (5/6) – Join Channels

- Peers that are permissioned can then join the channels they want to transact on  
`$ peer channel join ...`

## Bootstrapping the Network (6/6) – Instantiate Chaincode

- Peers finally instantiate the Chaincode on the channels they want to transact on  
**\$ peer chaincode instantiate ... -P ‘policy’**
- Once instantiated a Chaincode is live and can process transaction requests
- Endorsement Policy is specified at instantiation time

## **Endorsement Policies**

# Endorsement Policies

An endorsement policy describes the conditions by which a transaction can be endorsed. A transaction can only be considered valid if it has been endorsed according to its policy.

- Each chaincode is associated with an Endorsement Policy
- Default implementation: Simple declarative language for the policy
- ESCC (Endorsement System ChainCode) signs the proposal response on the endorsing peer
- VSCC (Validation System ChainCode) validates the endorsements

# Endorsement Policy Syntax

```
$ peer chaincode instantiate  
-C mychannel  
-n mycc  
-v 1.0  
-p chaincode_example02  
-c '{"Args":["init","a", "100",  
"b","200"]}'  
-P "AND('Org1MSP.member')"
```

This command instantiates the chaincode `mycc` on channel `mychannel` with the policy `AND('Org1MSP.member')`

Policy Syntax: `EXPR(E[, E...])`

Where `EXPR` is either AND or OR and `E` is either a principal or nested EXPR.

Principal Syntax: `MSP.ROLE`

Supported roles are: member and admin.

Where `MSP` is the MSP ID required, and `ROLE` is either “member” or “admin”.

## Endorsement Policy Examples

Examples of policies:

- Request 1 signature from all three principals
  - `AND('Org1.member', 'Org2.member', 'Org3.member')`
- Request 1 signature from either one of the two principals
  - `OR('Org1.member', 'Org2.member')`
- Request either one signature from a member of the Org1 MSP or (1 signature from a member of the Org2 MSP and 1 signature from a member of the Org3 MSP)
  - `OR('Org1.member', AND('Org2.member', 'Org3.member'))`

## **Permissioned Ledger Access**

# Membership Services Overview

# Transaction and Identity Privacy

- Enrollment Certificates, Ecerts
  - Long term identity
  - Can be obtained offline, bring-your-own-identity
- Permissioned Interactions
  - Users sign with their Ecrt
- Membership Services
  - Abstract layer to credential providers

# Membership Services Provider API

## Membership Services Provider API

- Pluggable interface supporting a range of credential architectures
- Default implementation calls Fabric-CA.
- Governs identity for Peers and Users.
- Provides:
  - User authentication
  - User credential validation
  - Signature generation and verification
  - Optional credential issuance
- Additional offline enrollment options possible (eg File System).

# MSP and BCCSP (Modularity and Decentralisation)

# Membership Services Provider (MSP)

- An abstraction to represent a membership authority and its operations on issuing and management of Hyperledger Fabric membership credentials in a modular & pluggable way
  - Allows for the co-existence of a variety of credential management architectures
  - Allows for easy organizational separation in credential management/administration operations according to business rules at a technical level
  - Potential to smoothly easily support different standards and membership implementations
  - Easy and straight-forward interface that the core can understand
- Described by a generic interface to cover:
  - User credential validation
  - User (anonymous but traceable) authentication: signature generation and verification
  - User attribute authentication: attribute ownership proof generation, and verification
  - (optionally) User credential issue

# Blockchain Crypto Service Provider (BCCSP)

- Pluggable implementation of cryptographic standards and algorithms.
- Pluggability
  - alternate implementations of crypto interface can be used within the Hyperledger Fabric code, without modifying the core
- Support for Multiple CSPs
  - Easy addition of more types of CSPs, e.g., of different HSM types
  - Enable the use of different CSP on different system components transparently
- International Standards Support
  - E.g., via a new/separate CSP
  - Interoperability among standards is not necessarily guaranteed

# Fabric-CA Details

## Fabric-CA

- Default implementation of the Membership Services Provider Interface.
- Issues Ecerts (long-term identity)
- Supports clustering for HA characteristics
- Supports LDAP for user authentication
- Supports HSM

# Fabric-CA

## Certificate Authority

- Issues Ecerts and manages renewal and revocation
- Supports:
  - Clustering for HA characteristics
  - LDAP server for registration and enrollment
  - Hardware Security Modules

# New User Registration and Enrollment

## Registration and Enrollment

- Admin registers new user with Enroll ID
- User enrolls and receives credentials
- Additional offline registration and enrollment options available

# Application Level Encryption

## Data Encryption

Handled in the application domain.

Multiple options for encrypting:

- Transaction Data
- Chaincode\*
- World-State data

Chaincode optionally deployed with cryptographic material, or receive it in the transaction from the client application using the [transient](#) data field (not stored on the ledger).

\*Encryption of application chaincode requires additional development of system chaincode.

# **Pluggable World State**

# WorldState Database

- Pluggable worldstate database
- Default embedded key/value implementation using LevelDB
  - Support for keyed queries, but cannot query on value
- Support for Apache CouchDB
  - Full query support on key and value (JSON documents)
  - Meets a large range of chaincode, auditing, and reporting requirements
  - Will support reporting and analytics via data replication to an analytics engine such as Spark (future)
  - Id/document data model compatible with existing chaincode key/value programming model

## **Summary and Next Steps**

- Apply shared ledgers and smart contracts to your Business Network
- Think about your participants, assets and business processes
- Spend time thinking about realistic business use cases
- Get some hands-on experience with the technology
- Start with a First Project
- IBM can help with your journey

# Thank you
